The height-one field

Set s(x) = 0 for all $x \in \Lambda \Subset \mathbb{Z}^d$

The height-one field

- Set s(x) = 0 for all $x \in \Lambda \Subset \mathbb{Z}^d$
 - 1. Choose a site x uniformly at random

The height-one field

Set s(x) = 0 for all $x \in \Lambda \Subset \mathbb{Z}^d$

- 1. Choose a site x uniformly at random
- 2. $s(x) \rightsquigarrow s(x) + 1$

The height-one field

Set s(x) = 0 for all $x \in \Lambda \Subset \mathbb{Z}^d$

- 1. Choose a site x uniformly at random
- 2. $s(x) \rightsquigarrow s(x) + 1$
- 3. If $s(x) \ge 2d$ (instability), topple x sending one "grain" to each neighbor

The height-one field

Set s(x) = 0 for all $x \in \Lambda \Subset \mathbb{Z}^d$

- 1. Choose a site x uniformly at random
- 2. $s(x) \rightsquigarrow s(x) + 1$
- 3. If $s(x) \ge 2d$ (instability), topple x sending one "grain" to each neighbor

If other sites become unstable, topple them as well

The height-one field

Set s(x) = 0 for all $x \in \Lambda \Subset \mathbb{Z}^d$

- 1. Choose a site x uniformly at random
- 2. $s(x) \rightsquigarrow s(x) + 1$
- 3. If $s(x) \ge 2d$ (instability), topple x sending one "grain" to each neighbor
 - If other sites become unstable, topple them as well
 - \blacktriangleright Grains outside Λ are lost

The height-one field

Set s(x) = 0 for all $x \in \Lambda \Subset \mathbb{Z}^d$

- 1. Choose a site x uniformly at random
- 2. $s(x) \rightsquigarrow s(x) + 1$
- 3. If $s(x) \ge 2d$ (instability), topple x sending one "grain" to each neighbor
 - If other sites become unstable, topple them as well
 - Grains outside Λ are lost
- 4. Go to 1.

The height-one field

Set s(x) = 0 for all $x \in \Lambda \Subset \mathbb{Z}^d$

- 1. Choose a site x uniformly at random
- 2. $s(x) \rightsquigarrow s(x) + 1$
- 3. If $s(x) \ge 2d$ (instability), topple x sending one "grain" to each neighbor
 - If other sites become unstable, topple them as well
 - Grains outside Λ are lost
- 4. Go to 1.

This Markov chain has a unique stationary measure \mathbb{P} . We look at

Definition (Height-one field) $h_{\Lambda}(x) := \mathbf{1}_{\{s(x)=1\}}$ under \mathbb{P}

$$s(x) = 15\,\delta_{x=(0,0)} + 2\,\delta_{x=(1,0)}$$

Stable configuration!

Going larger

Figure: Sandpile configuration on a 300×300 box.

The height one field

Joint cumulants

Joint cumulants κ for r. v.'s $X_1,\,\ldots,\,X_n$ are defined by

$$E\left[\prod_{i=1}^{n} X_{i}\right] = \sum_{\pi \text{ partition of } \{1, \dots, n\}} \prod_{B \in \pi} \kappa(X_{i} : i \in B)$$

Joint cumulants

Joint cumulants κ for r. v.'s X_1, \ldots, X_n are defined by

$$E\left[\prod_{i=1}^{n} X_{i}\right] = \sum_{\pi \text{ partition of } \{1, \dots, n\}} \prod_{B \in \pi} \kappa(X_{i}: i \in B)$$

Example

$$\kappa(X) = E[X], \ \kappa(X, \ Y) = \operatorname{cov}(X, \ Y)$$

Joint cumulants

Joint cumulants κ for r. v.'s X_1, \ldots, X_n are defined by

$$E\left[\prod_{i=1}^{n} X_{i}\right] = \sum_{\pi \text{ partition of } \{1, \dots, n\}} \prod_{B \in \pi} \kappa(X_{i}: i \in B)$$

Example

$$\kappa(X) = E[X], \ \kappa(X, \ Y) = \operatorname{cov}(X, \ Y)$$

We are going to study

 $\kappa(h(x_1),\ldots,h(x_n))$

Question

• Can there be random variables with cumulants equal to

 $\kappa(h(x_1),\ldots,h(x_n))?$

Question

• Can there be random variables with cumulants equal to

 $\kappa(h(x_1),\ldots,h(x_n))?$

• Regardless of the microscopic details of the model, what is the "driving force" behind height one?

Ingredients

• Let $U \subset \mathbb{R}^2$ be smooth connected bounded and $\Lambda := U_\epsilon := {}^U\!/_\epsilon \cap \mathbb{Z}^2$ • Let

$$U \ni u \mapsto u_{\epsilon} = \lfloor u/\epsilon \rfloor \in U_{\epsilon}$$

• Let $g_U(\cdot,\,\cdot)$ be the harmonic Green's function on U with Dirichlet boundary conditions

Figure: $U = B(0,1), U_{\epsilon} = B(0,2) \cap \mathbb{Z}^2, \ \epsilon = 1/2, u = (1/2, 1/2), u_{\epsilon} = (1,1)$

Height-one field in d = 2

Theorem (Dürre (2009))

Theorem 2 (Scaling Limit for the Height One Joint Cumulants). Let V be as in Theorem 1 and suppose $|V| \ge 2$. Then as $\epsilon \to 0$ the rescaled joint cumulant $\epsilon^{-2|V|}\kappa \left(h_{U_{\epsilon}}(v_{\epsilon}) : v \in V\right)$ converges to

$$\kappa_U(v:v\in V):=-C^{|V|}\sum_{\sigma\in\mathcal{S}_{\mathrm{cycl}}(V)}\sum_{(k^v)_{v\in V}\in\{x,y\}^V}\prod_{v\in V}\partial_{k^v}^{(1)}\partial_{k^{\sigma(v)}}^{(2)}g_U\left(v,\sigma(v)\right).$$

Here $C := (2/\pi) - (4/\pi^2)$. That is, if we write $\kappa_U(v) := 0$ for all $v \in V$, then

$$\lim_{\epsilon \to 0} \epsilon^{-2|V|} \mathbb{E}\left[\prod_{v \in V} \left(h_{U_{\epsilon}}(v_{\epsilon}) - \mathbb{E}[h_{U_{\epsilon}}(v_{\epsilon})]\right)\right] = \sum_{\Pi \in \Pi(V)} \prod_{B \in \Pi} \kappa_{U}(v : v \in B).$$

The connection to GFF

Let Ψ be a Gaussian free field with 0-boundary conditions on $U{:}$

Definition (GFF)

 Ψ is the centered Gaussian random distribution with

$$\mathbb{E}[\Psi(x)\Psi(y)] = g_U(x, y), \quad x \neq y \in U.$$

The connection to GFF

Let Ψ be a Gaussian free field with 0-boundary conditions on $U{:}$

Definition (GFF)

 Ψ is the centered Gaussian random distribution with

$$\mathbb{E}[\Psi(x)\Psi(y)] = g_U(x, y), \quad x \neq y \in U.$$

🖙 Antal Járai: formal computations show that

$$\lim_{\epsilon \to 0} \epsilon^{-2|V|} \kappa_U(h_{U_{\epsilon}}(v) : v \in V) = \kappa_U(: \|\nabla \Psi(v)\|^2 :, v \in V)$$

The connection to GFF

Let Ψ be a Gaussian free field with 0-boundary conditions on $U{:}$

Definition (GFF)

 Ψ is the centered Gaussian random distribution with

$$\mathbb{E}[\Psi(x)\Psi(y)] = g_U(x, y), \quad x \neq y \in U.$$

🖙 Antal Járai: formal computations show that

We investigated this conjecture

Definition (DGFF)

Let $(\Gamma_{\epsilon}(v): v \in U_{\epsilon})$ be the discrete GFF on U_{ϵ} :

 $\mathbb{E}[\Gamma_{\epsilon}(v)] = 0, \quad \mathbb{E}[\Gamma_{\epsilon}(v)\Gamma_{\epsilon}(u)] = G_{U_{\epsilon}}(u, v)$

where $G_{U_{\epsilon}}(\cdot, \cdot)$ is the discrete harmonic Green's function with Dirichlet b.c.

Definition (DGFF)

Let $(\Gamma_{\epsilon}(v): v \in U_{\epsilon})$ be the discrete GFF on U_{ϵ} :

$$\mathbb{E}[\Gamma_{\epsilon}(v)] = 0, \quad \mathbb{E}[\Gamma_{\epsilon}(v)\Gamma_{\epsilon}(u)] = G_{U_{\epsilon}}(u, v)$$

where $G_{U_{\epsilon}}(\cdot, \cdot)$ is the discrete harmonic Green's function with Dirichlet b.c.

Definition (Grad squared DGFF)

The field $(\Phi_{\epsilon}(v): v \in U_{\epsilon})$ is defined as

$$\Phi_{\epsilon}(v) = \sum_{i=1}^{d} : \nabla_{i}\Gamma_{\epsilon}(x)^{2} := \sum_{i=1}^{d} : (\Gamma_{\epsilon}(v+e_{i}) - \Gamma_{\epsilon}(v))^{2}$$

Definition (DGFF)

Let $(\Gamma_{\epsilon}(v): v \in U_{\epsilon})$ be the discrete GFF on U_{ϵ} :

$$\mathbb{E}[\Gamma_{\epsilon}(v)] = 0, \quad \mathbb{E}[\Gamma_{\epsilon}(v)\Gamma_{\epsilon}(u)] = G_{U_{\epsilon}}(u, v)$$

where $G_{U_{\epsilon}}(\cdot, \cdot)$ is the discrete harmonic Green's function with Dirichlet b.c.

Definition (Grad squared DGFF)

The field $(\Phi_{\epsilon}(v): v \in U_{\epsilon})$ is defined as

$$\Phi_{\epsilon}(v) = \sum_{i=1}^{d} : \nabla_{i}\Gamma_{\epsilon}(x)^{2} := \sum_{i=1}^{d} : (\Gamma_{\epsilon}(v+e_{i}) - \Gamma_{\epsilon}(v))^{2}$$

We will work in $d \ge 2$ (d = 1: manual calculations)

Covariances

$$\begin{aligned} \mathsf{Call}\ [d] &:= \{1, \dots, d\}. \\ &\mathsf{E}\left[\Phi_{\epsilon}(x_{\epsilon})\Phi_{\epsilon}(y_{\epsilon})\right] = 2\sum_{i,j\in[d]} \left(\nabla_{i}^{(1)}\nabla_{j}^{(2)}G_{U_{\epsilon}}(x_{\epsilon}, y_{\epsilon})\right)^{2} \end{aligned}$$

Convergence of cumulants

Theorem (Cipriani, Hazra, Rapoport, Ruszel 2023)

Let \mathcal{E} be the set of coordinate vectors of \mathbb{R}^d . Let $\{x^{(1)}, \ldots, x^{(k)}\} \subset U$. Let $S^0_{\text{cycl}}(B)$ be the set of cyclic permutations of a set B without fixed points. If $x^{(i)} \neq x^{(j)}$ for all $i \neq j$, then

Convergence of cumulants

Theorem (Cipriani, Hazra, Rapoport, Ruszel 2023)

Let \mathcal{E} be the set of coordinate vectors of \mathbb{R}^d . Let $\{x^{(1)}, \ldots, x^{(k)}\} \subset U$. Let $S^0_{\mathrm{cycl}}(B)$ be the set of cyclic permutations of a set B without fixed points. If $x^{(i)} \neq x^{(j)}$ for all $i \neq j$, then

$$\lim_{\epsilon \to 0} \epsilon^{-dk} \kappa \left(\Phi_{\epsilon} \left(x_{\epsilon}^{(j)} \right) : j \in [k] \right) = 2^{k-1} \sum_{\sigma \in S_{\text{cycl}}^{0}([k])} \sum_{\eta:[k] \to \mathcal{E}} \prod_{j=1}^{k} \partial_{\eta(j)}^{(1)} \partial_{\eta(\sigma(j))}^{(2)} g_{U} \left(x_{\epsilon}^{(j)}, x_{\epsilon}^{(\sigma(j))} \right)$$

In d = 2 the limit is conformally covariant with scale dimension 2

 - use estimates for double derivatives of the Green's function in a domain

- 1. Φ_{ϵ} is tight in an appropriate local Besov-Hölder space using a tightness criterion of Furlan–Mourrat (2017)
 - control of the summability of k-point functions
 - use estimates for double derivatives of the Green's function in a domain
- 2. Determine the finite-dimensional distributions

- 1. Φ_{ϵ} is tight in an appropriate local Besov-Hölder space using a tightness criterion of Furlan–Mourrat (2017)
 - control of the summability of k-point functions
 - use estimates for double derivatives of the Green's function in a domain
- 2. Determine the finite-dimensional distributions
 - vanishing cumulants of order at least three

Proofs White noise

- 1. Φ_{ϵ} is tight in an appropriate local Besov-Hölder space using a tightness criterion of Furlan–Mourrat (2017)
 - control of the summability of k-point functions
 - use estimates for double derivatives of the Green's function in a domain
- 2. Determine the finite-dimensional distributions
 - vanishing cumulants of order at least three
 - the limiting covariance structure is the $L^2(U)$ inner product

Why these cumulants?

To answer, we need to look at the proof first...

Useful facts: cumulants

• $T((x_{\epsilon}, x_{\epsilon} + e), (y_{\epsilon}, y_{\epsilon} + e')) = \epsilon^d dg_U|_{(x,y)}(e, e') + o(\epsilon^d)$ (Kassel–Wu, 2013).

k-point functions

We derive cumulants from k-point functions:

$$\mathbb{E}\left[\prod_{j=1}^{k} \Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right)\right] = \sum_{\pi \in \Pi([k])} \prod_{B \in \pi} \kappa\left(\Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right) : j \in B\right)$$

k-point functions

We derive cumulants from k-point functions:

$$\mathbb{E}\left[\prod_{j=1}^{k} \Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right)\right] = \sum_{\pi \in \Pi([k])} \prod_{B \in \pi} \kappa\left(\Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right) : j \in B\right)$$

1. Decompose k-point functions as Feynman diagrams

k-point functions

We derive cumulants from k-point functions:

$$\mathbb{E}\left[\prod_{j=1}^{k} \Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right)\right] = \sum_{\pi \in \Pi([k])} \prod_{B \in \pi} \kappa\left(\Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right) : j \in B\right)$$

- 1. Decompose k-point functions as Feynman diagrams
- 2. Expand the products of covariances in terms of the transfer matrix

k-point functions

We derive cumulants from k-point functions:

$$\mathbb{E}\left[\prod_{j=1}^{k} \Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right)\right] = \sum_{\pi \in \Pi([k])} \prod_{B \in \pi} \kappa\left(\Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right) : j \in B\right)$$

- 1. Decompose k-point functions as Feynman diagrams
- 2. Expand the products of covariances in terms of the transfer matrix
- 3. Use the transfer matrix expansion

k-point functions

We derive cumulants from k-point functions:

$$\mathbb{E}\left[\prod_{j=1}^{k} \Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right)\right] = \sum_{\pi \in \Pi([k])} \prod_{B \in \pi} \kappa\left(\Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right) : j \in B\right)$$

- 1. Decompose k-point functions as
- 2. Expand the products of covariances in terms of the transfer matrix
- 3. Use the transfer matrix expansion

For ASP the proof uses explicitly the relation with the spanning tree measure

k-point functions

We derive cumulants from k-point functions:

$$\mathbb{E}\left[\prod_{j=1}^{k} \Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right)\right] = \sum_{\pi \in \Pi([k])} \prod_{B \in \pi} \kappa\left(\Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right) : j \in B\right)$$

- 1. Decompose k-point functions as
- 2. Expand the products of covariances in terms of the transfer matrix
- 3. Use the transfer matrix expansion

☞ For ASP the proof uses explicitly the relation with the spanning tree measure
☞ Kassel-Wu generalize this to models related to the spanning tree measure
conjecturing a universal and conformally covariant limit

k-point functions

We derive cumulants from k-point functions:

$$\mathbb{E}\left[\prod_{j=1}^{k} \Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right)\right] = \sum_{\pi \in \Pi([k])} \prod_{B \in \pi} \kappa\left(\Phi_{\epsilon}\left(x_{\epsilon}^{(j)}\right) : j \in B\right)$$

- 1. Decompose k-point functions as Feynman diagrams
- 2. Expand the products of covariances in terms of the transfer matrix
- 3. Use the transfer matrix expansion

☞ For ASP the proof uses explicitly the relation with the spanning tree measure
☞ Kassel-Wu generalize this to models related to the spanning tree measure
conjecturing a universal and conformally covariant limit

Cumulants: another viewpoint

In the proof we (loosely) obtain that the k-point function is

$$\sum_{\gamma \text{ FD on } [2k]} \prod_{\left((x_{\epsilon}^{(j)}, x_{\epsilon}^{(j)} + e), (x_{\epsilon}^{(m)}, x_{\epsilon}^{(m)} + e')\right) \in \gamma} \epsilon^{-d} T\Big((x_{\epsilon}^{(j)}, x_{\epsilon}^{(j)} + e), (x_{\epsilon}^{(m)}, x_{\epsilon}^{(m)} + e')\Big)$$

Cumulants: another viewpoint

In the proof we (loosely) obtain that the k-point function is

$$\sum_{\gamma \text{ FD on } [2k]} \prod_{\left((x_{\epsilon}^{(j)}, x_{\epsilon}^{(j)} + e), (x_{\epsilon}^{(m)}, x_{\epsilon}^{(m)} + e')\right) \in \gamma} \underbrace{\epsilon^{-d} T\Big(\big(x_{\epsilon}^{(j)}, x_{\epsilon}^{(j)} + e\Big) \Big), \big(x_{\epsilon}^{(m)}, x_{\epsilon}^{(m)} + e'\big) \Big)}_{\approx \partial_{e} \partial_{e'} g_{U}(x^{(j)}, x^{(m)})}$$

Fermionic (or Grassmannian) calculus

Definition (Grassmanian variables)

Let $\{\xi_i,\,\bar{\xi_i}:\,i\in\Lambda\}$ be symbols that satisfy for all $i,\,j$

$$\xi_i\xi_j = -\xi_j\xi_i, \quad \xi_i\bar{\xi}_j = -\bar{\xi}_j\xi_i, \quad \bar{\xi}_i\bar{\xi}_j = -\bar{\xi}_j\bar{\xi}_i$$

Fermionic (or Grassmannian) calculus

Definition (Grassmanian variables)

Let $\{\xi_i,\,\bar\xi_i:\,i\in\Lambda\}$ be symbols that satisfy for all $i,\,j$

$$\xi_i\xi_j = -\xi_j\xi_i, \quad \xi_i\bar{\xi}_j = -\bar{\xi}_j\xi_i, \quad \bar{\xi}_i\bar{\xi}_j = -\bar{\xi}_j\bar{\xi}_i$$

Example

Used in physics to model Fermi–Dirac statistics (opposed to Bose–Einstein statistics)

Definition (fGFF)

For every function F of $\{\pmb{\xi},\bar{\pmb{\xi}}\}=\{\xi_i,\,\bar{\xi}_i:i\in\Lambda\}$ the expectation of F under the fGFF is defined as

$$[F]_{fGFF} = \int_{Berezin} \mathrm{d}\bar{\boldsymbol{\xi}} \mathrm{d}\boldsymbol{\xi} \,\mathrm{e}^{(\boldsymbol{\xi}, -\Delta_{\Lambda}\bar{\boldsymbol{\xi}})} F.$$

Definition (fGFF)

For every function F of $\{\xi, \overline{\xi}\} = \{\xi_i, \overline{\xi}_i : i \in \Lambda\}$ the expectation of F under the fGFF is defined as

$$[F]_{fGFF} = \int_{Berezin} \mathrm{d}\bar{\boldsymbol{\xi}} \mathrm{d}\boldsymbol{\xi} \,\mathrm{e}^{(\boldsymbol{\xi}, -\Delta_{\Lambda}\bar{\boldsymbol{\xi}})} F.$$

Compare with

$$[F]_{DGFF} \propto \int_{\mathbb{R}^d} \mathrm{d}\boldsymbol{\varphi} \,\mathrm{e}^{\frac{1}{4d}(\boldsymbol{\varphi}, -\Delta_{\Lambda}\boldsymbol{\varphi})} F$$

Definition (fGFF)

For every function F of $\{\xi, \overline{\xi}\} = \{\xi_i, \overline{\xi}_i : i \in \Lambda\}$ the expectation of F under the fGFF is defined as

$$[F]_{fGFF} = \int_{Berezin} \mathrm{d}\bar{\boldsymbol{\xi}} \mathrm{d}\boldsymbol{\xi} \,\mathrm{e}^{(\boldsymbol{\xi}, -\Delta_{\Lambda}\bar{\boldsymbol{\xi}})} F.$$

Compare with

$$[F]_{DGFF} \propto \int_{\mathbb{R}^d} \mathrm{d}\boldsymbol{\varphi} \,\mathrm{e}^{\frac{1}{4d}(\boldsymbol{\varphi}, -\Delta_{\Lambda}\boldsymbol{\varphi})} F$$

Example

$$[1]_{fGFF} = \int_{Ber} \mathrm{d}\bar{\boldsymbol{\xi}} \mathrm{d}\boldsymbol{\xi} \,\mathrm{e}^{(\boldsymbol{\xi}, -\Delta_{\Lambda}\bar{\boldsymbol{\xi}})} = \det(-\Delta_{\Lambda})$$

Definition (fGFF)

For every function F of $\{\xi, \overline{\xi}\} = \{\xi_i, \overline{\xi}_i : i \in \Lambda\}$ the expectation of F under the fGFF is defined as

$$[F]_{fGFF} = \int_{Berezin} \mathrm{d}\bar{\boldsymbol{\xi}} \mathrm{d}\boldsymbol{\xi} \,\mathrm{e}^{(\boldsymbol{\xi}, -\Delta_{\Lambda}\bar{\boldsymbol{\xi}})} F.$$

Compare with

$$[F]_{DGFF} \propto \int_{\mathbb{R}^d} \mathrm{d}\boldsymbol{\varphi} \,\mathrm{e}^{\frac{1}{4d}(\boldsymbol{\varphi}, -\Delta_{\Lambda}\boldsymbol{\varphi})} F$$

Example

$$[1]_{fGFF} = \int_{Ber} \mathrm{d}\bar{\boldsymbol{\xi}} \mathrm{d}\boldsymbol{\xi} \,\mathrm{e}^{(\boldsymbol{\xi}, -\Delta_{\Lambda}\bar{\boldsymbol{\xi}})} = \det(-\Delta_{\Lambda})$$
$$\int_{\mathbb{R}^{d}} \mathrm{d}\boldsymbol{\varphi} \,\mathrm{e}^{\frac{1}{4d}(\boldsymbol{\varphi}, -\Delta_{\Lambda}\boldsymbol{\varphi})} \propto \left(\det(-\Delta_{\Lambda})\right)^{-1/2}$$
"Fermionic gradient squared"

For
$$v \in \Lambda = U_{\epsilon}$$

$$X_{v} = \frac{1}{2d} \sum_{e \ni v \text{ edges}} \zeta(e)$$
$$\zeta(e) = \left(\xi_{v} - \xi_{u}\right) \left(\bar{\xi}_{v} - \bar{\xi}_{u}\right), \quad e = \{v, u\}$$

Theorem (CCRR, 2023)

$$\lim_{\epsilon \to 0} \epsilon^{-2n} \kappa \left(h_{U_{\epsilon}} \left(v_{\epsilon}^{(1)} \right), \dots, h_{U_{\epsilon}} \left(v_{\epsilon}^{(n)} \right) \right)$$
$$\lim_{\epsilon \to 0} \epsilon^{-2n} \kappa \left(-CX_{v_{\epsilon}^{(1)}}, \dots, -CX_{v_{\epsilon}^{(n)}} \right).$$

Summary

We studied the scaling limit of Φ_ϵ as a random distribution and the scaling limit of its k-point functions/cumulants

• As a random distribution the limit is WN as height-one field: common decay of correlations

Summary

We studied the scaling limit of Φ_ϵ as a random distribution and the scaling limit of its k-point functions/cumulants

- As a random distribution the limit is WN as height-one field: common decay of correlations
- The cumulants have the same limit as in the height-one field (up to sign) and conformal covariance property

Summary

We studied the scaling limit of Φ_ϵ as a random distribution and the scaling limit of its k-point functions/cumulants

- As a random distribution the limit is WN as height-one field: common decay of correlations
- The cumulants have the same limit as in the height-one field (up to sign) and conformal covariance property
- the Fermionic free field kind of identifies the height-one field and gives an alternative the gradient free field squared.

Open questions

• Can one make sense of the scaling limit which captures the correlations?

Open questions

- Can one make sense of the scaling limit which captures the correlations?
- what about other height fields?

Open questions

- Can one make sense of the scaling limit which captures the correlations?
- what about other height fields?
- Can one obtain other limits (than white noise) for these fields?

Open questions

- Can one make sense of the scaling limit which captures the correlations?
- what about other height fields?
- Can one obtain other limits (than white noise) for these fields?
